

Deploying the Assembler on Hyper-V

Version 1.5

This document describes how to deploy the Assembler on Hyper-V. Once you have completed the steps outlined in this document, refer back to the [“Getting started with Expel”](#) document for further instructions.

Note: This procedure may be slightly different based on your version of Microsoft Windows.

Deploy the Assembler virtual machine in your network

1. Right click on the downloaded file to open the context menu and choose “Extract All”.
2. Run the “Hyper-V Manager” from the **Start** menu.
3. From the **Action** menu, choose **Import Virtual Machine**.
4. In the **Locate Folder** step, choose the “expel-assembler” folder that you extracted.
5. Select the “expel-assembler” virtual machine.
6. On the **Choose Import Type** step, choose “Copy the virtual machine”.
7. Choose a destination (accept the defaults if you don’t know where to put it).
8. Choose storage folders (accept the defaults if you’re not sure what to do).
9. Click the **Finish** button.
10. In the Hyper-V Manager, choose the expel-assembler virtual machine.
11. Click **Start** to power on the virtual machine.
12. Choose **Connect** to access the console of the virtual machine.

Continue with the “Activate the Assembler in the Expel Workbench” step in the “Getting started with Expel” document.
